

## SPECIFICATION

## NOVEL BICYCLONUCLEOSIDE AND OLIGONUCLEOTIDE ANALOGUE

## TECHNICAL FIELD

- 5 This invention relates to a novel nucleoside analogue and a novel nucleotide analogue, and more particularly, to a nucleotide analogue suitable as an antisense molecule.

## BACKGROUND ART

- 10 In 1978, it was reported for the first time that an antisense molecule inhibited influenza virus infection.
- 15 Since then, reports have been issued that antisense molecules inhibited the expression of oncogenes and AIDS infection. In recent years, antisense oligonucleotides have become one of the most promising pharmaceuticals, because they specifically control the expression of undesirable genes.

- 20 The antisense method is based on the idea of controlling a unidirectional flow called the central dogma, i.e., DNA → RNA → protein, by use of an antisense oligonucleotide.
- 25 When a naturally occurring oligonucleotide was applied to this method as an antisense molecule, however, it was decomposed with various nucleases in vivo, or its permeation through the cell membrane was not high. To solve these problems, numerous nucleic acid derivatives and analogues have been synthesized, and their studies have been conducted. Examples of the synthesized products include a phosphorothioate having a sulfur atom substituting for an oxygen atom on the phosphorus atom, and a methylphosphonate

09380638-090799

having a substituting methyl group. Recently, products have been synthesized in which the phosphorus atom has also been substituted by a carbon atom, or the structure of the sugar portion has been changed, or the nucleic acid base has been modified. Any resulting derivatives or analogues, however, have not been fully satisfactory in terms of in vivo stability, ease of synthesis, and sequence specificity (the property of selectively controlling the expression of a particular gene alone).

Under these circumstances, there has been a demand for the creation of an antisense molecule which is minimally decomposed with a nuclease in vivo, binds to target messenger RNA with high affinity, has high specificity, and can thus efficiently control the expression of a particular gene.

#### DISCLOSURE OF THE INVENTION

The inventors of the present invention designed a nucleic acid analogue with immobilized conformation of the sugar portion in a nucleic acid, which would be useful in the antisense method. They synthesized a nucleoside analogue which will be a unit structure therefor, and confirmed that an oligonucleotide analogue prepared using it was very useful as an antisense molecule.

The structure of a nucleoside analogue according to the present invention is a nucleoside analogue of the following general formula (I)

(I)

where B is a pyrimidine or purine nucleic acid base, or an analogue thereof, and X and Y are identical or different, and each represent a hydrogen atom, an alkyl group, an alkenyl group, an alkynyl group, a cycloalkyl group, an aralkyl group, an aryl group, an acyl group, or a silyl group, or an amidite derivative thereof.

The alkyl group represents a straight chain or branched chain alkyl group with 1 to 20 carbon atoms. Its examples include methyl, ethyl, n-propyl, i-propyl, n-butyl, t-butyl, pentyl, hexyl, heptyl, octyl, nonyl and decyl.

The alkenyl group represents a straight chain or branched chain alkenyl group with 2 to 20 carbon atoms. Its examples include vinyl, allyl, butenyl, pentenyl, geranyl,

and farnesyl.

Subst  
12  
The alkynyl group represents a straight chain or branched chain alkynyl group with 2 to 20 carbon atoms. Its examples include ethynyl, propynyl, and butynyl.

5 The cycloalkyl group represents a cycloalkyl group with 3 to 8 carbon atoms, and includes, for example, cyclopropyl, cyclobutyl, cyclopentyl, cyclohexyl, cycloheptyl, and cyclooctyl. Another example is a heterocyclic group in which one or more arbitrary methylene  
10 groups on the ring of the cycloalkyl group have been substituted by an oxygen atom, a sulfur atom, or an alkyl-substituted nitrogen atom. It is, for instance, a tetrahydropyranyl group.

667060-8290866  
The aryl group refers to a monovalent substituent  
15 formed by removing one hydrogen atom from an aromatic heterocyclic group or an aromatic hydrocarbon group. Preferably, it represents a monovalent substituent formed by removing one hydrogen atom from an aromatic hydrocarbon group, and includes, for example, phenyl, tolyl, xylyl,  
20 biphenyl, naphthyl, anthryl, and phenanthryl. The carbon atom on the ring of the aryl group may be substituted by one or more of a halogen atom, a lower alkyl group, a hydroxyl group, an alkoxy group, an amino group, a nitro group, and a trifluoromethyl group. ~~The substituent in this case is, for example, a halogen atom, a hydroxyl group, an amino group, an alkoxy group, or an aryloxy group.~~

C C  
The aralkyl group refers to an alkyl group bonded to an aryl group, and may be substituted. The aralkyl group

that may be substituted represents an alkyl group bonded to an aryl group, with one or more arbitrary hydrogen atoms of the aryl group and the alkyl group being optionally substituted by the following substituents: Examples of the

5 substituents are acyl, amino, aryl, alkyl, cycloalkyl, alkoxy, hydroxyl, nitro, and halogen.

The amino group need not be substituted, but the amino group when substituted includes, for example, alkylamino, arylamino, and acylamino. Examples of the

10 alkoxy group are methoxy, ethoxy, n-propoxy, i-propoxy, n-butoxy, i-butoxy, s-butoxy, t-butoxy, pentyloxy, hexyloxy, and phenoxy. Examples of the halogen atom are fluorine, chlorine, bromine, and iodine.

The preferred examples of the aralkyl group are

15 trityl, benzyl, phenethyl, tritylmethyl, diphenylmethyl, naphthylmethyl, and 4,4'-dimethoxytrityl (DMTr). Particularly preferred is a DMTr group.

As the acyl group, acetyl, formyl, propionyl, benzoyl, and benzyloxycarbonyl can be exemplified. An example of the

20 silyl group is a trialkylsilyl group, preferably trimethylsilyl, triethylsilyl, triisopropylsilyl, t-butyldimethylsilyl or t-butyldiphenylsilyl, and more preferably trimethylsilyl.

via a phosphodiester bond, or an oligonucleotide or polynucleotide containing the nucleoside,  $n^1$ 's or  $n^2$ 's are identical or different, and each denote an integer of 0 to 50, provided that  $n^1$ 's or  $n^2$ 's are not zero at the same time, and that not all of  $n^2$ 's are zero at the same time,  $n^3$  denotes an integer of 1 to 50, provided that when  $n^1$  and/or  $n^2$  are or is 2 or more,  $B^1$  and  $B$  need not be identical, and  $R$ 's need not be identical.

The pyrimidine or purine nucleic acid base in the present invention refers to thymine, uracil, cytosine, adenine, guanine, or a derivative thereof.

The nucleoside analogue and nucleotide analogue of the present invention can be synthesized in the manner described below.

15

(1) Synthesis of nucleoside analogue

25

- Compound 1, synthesized from uridine in accordance with the literature [1) J.A. Secrist et al., J. Am. Chem. Soc., 101, 1554 (1979); 2) G.H. Jones et al., J. Org. Chem., 44, 1309 (1979)], was treated with tosyl chloride (TsCl) to
- 5 tosylate only one of the two primary alcohols, leading to Compound 2. Compound 2 was acid hydrolyzed into a triol compound 3. Compound 3 was condensed with benzaldehyde in the presence of an acid catalyst to form a benzylidene compound 4. Compound 4 was reduced with sodium
- 10 cyanoborohydride ( $\text{NaBH}_3\text{CN}$ ) in the presence of titanium tetrachloride ( $\text{TiCl}_4$ ) to obtain Compound 5. This compound was reacted with sodium hexamethyldisilazide ( $\text{NaHMDS}$ ) in tetrahydrofuran (THF) to obtain a bicyclo compound 6 (Compound I: B = uracil (U), X = H, Y = benzyl). When
- 15 Compound 6 was catalytically reduced in the presence of a palladium carbon catalyst, a diol compound 7 (Compound I: B = U, X = Y = H) was obtained. Further treatment of Compound 7 with 4,4'-dimethoxytrityl chloride (DMTrCl) gave a trityl compound 8 (Compound I: B = U, X = DMTr, Y = H).
- 20 Compounds 6, 7 and 8 can be used as starting materials for various compounds I.

Compounds (I) having various nucleic acid bases, whether natural or nonnatural, other than uridine, can be synthesized by any of the following three methods:

- 25 The first method is conversion from Compound 8. That is, Compound 8 is acetylated into Compound 9, and then reacted with 1,2,4-triazole to form Compound 10. Hydrolysis of this compound gave Compound 11 (Compound I): B =

cytosine (C), X = DMTr, Y = H). Compound 12 (Compound (I):  
B = benzoylcytosine ( $C^{Bz}$ ), X = DMTr, Y = H), which will  
become a starting material for oligonucleotide synthesis,  
can be easily obtained by benzylation of Compound 11.

15 The second method is a method performed via Compound  
13 which can be easily obtained from D-ribose in accordance  
with the literature [3) A.G.M. Barrett et al., J. Org. Chem.,  
55, 3853 (1990); 4) G.H. Jones et al., *ibid.*, 44, 1309  
(1979)]. That is, Compound 13 was led to Compound 16 by  
20 three steps, and cyclized under basic conditions to obtain a  
desired methylglycosyl compound 17. The OMe group at the 1-  
position of this compound can be substituted by different  
natural nucleic acid bases or nonnatural nucleic acid base  
analogues by various methods which have already been  
25 developed. For example, a method as shown by a scheme  
ranging from Compound 17 to Compound 20 can be employed.

T0110

The third method starts with diacetone D-glucose, which is obtained from D-glucose by one step and is commercially available. Compound 31 was prepared in accordance with a reference 5) R.D. Youssefyeh, J.P.H.

- 5 Verheyden and J.G. Moffatt., J. Org. Chem., 44, 1301-1309 (1979). Then, Compound 31 was treated as shown by the following scheme to protect the two primary hydroxyl groups with a t-butyldiphenylsilyl group and a p-toluenesulfonyl group progressively. The protected compound was acetylated into Compound 34.

- Compound 34 was condensed, separately, with thymine, benzoyladenine, and isobutyrylguanine activated upon trimethylsilylation (referred to as 2TMS·T, 2TMS·A<sup>Bz</sup>, and 3TMS·G<sup>iBu</sup>, respectively), to obtain Compounds 35, 40 and 44 in high yields, as indicated by the scheme offered below. Then, these condensates were subjected to deacetylation

(Compounds 36, 41, 45), five-membered ring formation  
(Compounds 37, 42, 46), desilylation (Compounds 38, 43, 47),  
and further debenzylation to form desired compounds 39.

(2) Synthesis of oligonucleotide analogue

Compound 8 is reacted with 2-cyanoethyl-N,N,N',N'-tetraisopropylphosphoramidite to obtain an amidite compound 21. This compound is combined with a naturally occurring nucleoside amidite, and subjected to a DNA synthesizer to synthesize various oligonucleotide analogues. The synthesized crude products are purified using a reversed phase chromatographic column (Oligo-Pak). The purity of the purified product is analyzed by HPLC, whereby the formation of a purified oligonucleotide analogue can be confirmed.

At least one monomer unit as compound 8 can be contained in the oligonucleotide analogue. Alternatively, the monomer units may be present at two or more locations in the oligonucleotide analogue in such a manner as to be separated from each other via one or more naturally occurring nucleotides. The present invention makes it possible to synthesize an antisense molecule incorporating a necessary number of the nucleotide analogues (nucleoside analogues) of the invention (a necessary length of the nucleotide or nucleoside analogue) at a necessary location. The length of the entire oligonucleotide analogue is 2 to 50, preferably 10 to 30, nucleoside units.

Such an oligonucleotide analogue (antisense molecule) is minimally degradable by various nucleases, and can be existent in vivo for a long time after administration. This antisense molecule functions, for example, to form a stable double helix together with a messenger RNA, thereby inhibiting the biosynthesis of a potentially pathogenic protein; or form a triple helix in combination with double-stranded DNA in a genome to inhibit transcription to messenger RNA. The oligonucleotide analogue can also suppress the proliferation of a virus which has infected.

In light of these findings, an oligonucleotide analogue (antisense molecule) using the nucleoside analogue of the present invention is expected to be useful as drugs, including antineoplastics and antivirals, for treatment of diseases by inhibiting the actions of particular genes.

The antisense molecule using the nucleotide (nucleoside) analogue of the present invention can be formulated into parenteral preparations or liposome preparations by incorporating customary auxiliaries such as buffers and/or stabilizers. As preparations for topical application, it may be blended with pharmaceutical carriers in common use to prepare ointments, creams, liquids or plasters.

Synthesis of the nucleoside analogue and nucleotide analogue of the present invention will be described in more detail by way of the following Examples and Production Examples. In these Examples, uracil is mainly used as a base, but other purine nucleic acid bases can also be used

similarly.

[Example 1] Synthesis of nucleoside analogue

(1) Synthesis of 2',3'-O-cyclohexylidene-4'-(p-toluenesulfonyloxymethyl)uridine (Compound 2)

5 To an anhydrous pyridine solution (13.5 ml) of Compound 1 (956 mg, 2.70 mmols) known in the literature, p-toluenesulfonyl chloride (771 mg, 4.05 mmols) was added at room temperature in a stream of nitrogen, and the mixture was stirred for 5 hours at 60°C.

10 To the reaction mixture, a saturated sodium bicarbonate solution was added, whereafter the reaction system was extracted with benzene 3 times. The organic phase was washed once with a saturated sodium chloride solution, and dried over anhydrous  $MgSO_4$ . The solvents were  
15 distilled off under reduced pressure, and the residue was subjected to azeotropy with benzene 3 times. The resulting crude product was purified by silica gel column chromatography ( $CHCl_3:MeOH = 15:1$ ), and then reprecipitated from benzene-hexane to obtain a white powder (Compound 2)  
20 (808 mg, 1.59 mmols, 59%).

Mass (EI): m/z 256 (M<sup>+</sup>-OTs).

25 (3) Synthesis of 2',3'-O-benzylidene-4'-(p-toluenesulfonyloxymethyl)uridine (Compound 4)

In a stream of nitrogen, benzaldehyde (2.4 ml, excess) and zinc chloride (670 mg, 5.0 mmols) were added to

the above compound 3 (400 mg, 0.93 mmols), and the mixture was stirred for 5 hours at room temperature. After the reaction was stopped by addition of a saturated sodium bicarbonate solution, the reaction mixture was extracted with chloroform, and washed with a saturated sodium bicarbonate solution, water, and a saturated sodium chloride solution. The organic phase was dried over anhydrous sodium sulfate. The solvents were distilled off under reduced pressure, and the residue was purified by silica gel column chromatography ( $\text{CHCl}_3$ :MeOH = 40:1) to obtain Compound 4 (380 mg, 0.74 mmol, 80%).

(7) 5'-O-(4,4'-dimethoxytrityl)-2'-O,4'-C-methyleneuridine (Compound 8)

To Compound 7 (140 mg, 0.53 mmol), anhydrous pyridine was added, followed by performing azeotropy of the mixture 3 times. Then, the product was converted into an anhydrous pyridine solution (1.5 ml), and 4,4'-dimethoxytrityl chloride (210 mg, 0.63 mmol) and DMAP (6.5 mg, 0.053 mmol) were added at room temperature in a stream of nitrogen. The mixture was stirred for 5 hours at room temperature. To the reaction mixture, a saturated sodium bicarbonate solution was added, followed by extraction with  $\text{CH}_2\text{Cl}_2$ . The organic phase was washed with water and a saturated sodium chloride solution, and then dried over anhydrous sodium sulfate. After the solvents were distilled off under reduced pressure, the resulting crude product was purified by silica gel column chromatography ( $\text{CHCl}_3$ :MeOH = 40:1) to obtain Compound 8 (230 mg, 0.34 mmol, 66%).

- (1) Synthesis of 2'-O-acetyl-3'-O-benzyl-5'-O-t-butylidiphenylsilyl-4'-p-toluenesulfonyloxymethyl-N<sup>2</sup>-isobutyrylguanosine (Compound 44)
- In a stream of nitrogen, a 1,2-dichloroethane solution (5.0 ml) of Compound 4 (250 mg, 0.336 mmol) and trimethylsilyltrifluoromethane sulfonate (6.7  $\mu\text{l}$ , 0.0336 mmol) were added, at room temperature, to 3TMS·G<sup>1B</sup> (146.8 mg, 0.336 mmol) prepared in accordance with the aforementioned reference 6). The mixture was heated under reflux for 15

- hours. After a saturated sodium bicarbonate solution was added to the reaction mixture, the system was extracted 3 times with methylene chloride. The organic phase was washed with a saturated sodium chloride solution, and then dried over sodium sulfate. The solvents were distilled off under reduced pressure, and the resulting crude product was purified by silica gel column chromatography ( $\text{CHCl}_3$ -MeOH, 30:1) to obtain a white powder, Compound 44 (213.6 mg, 0.235 mmol, 70%).

Compound 8 (200 mg, 0.31 mmol) and  
5 diisopropylammonium tetrazolide (39.6 mg, 0.23 mmol) were  
subjected to azeotropy with anhydrous  $\text{CH}_3\text{CN}$  three times, and  
then the system was converted into an anhydrous  $\text{CH}_3\text{CN}$ -  
anhydrous THF solution (3:1, 4 ml). In a stream of nitrogen,  
2-cyanoethyl N,N,N',N'-tetraisopropylphosphorodiamidite  
10 (0.12 ml, 0.37 mmol) was added, and the mixture was stirred  
for 90 minutes at room temperature. The solvents were  
distilled off under reduced pressure, and the resulting  
crude product was purified by silica gel column  
chromatography (AcOEt:hexane:Et<sub>3</sub>N = 75:25:1). Then, the  
15 purified product was reprecipitated from AcOEt-hexane to  
obtain an amidite compound 21 (181 mg, 0.25 mmol, 81%).

(2) General synthesis of oligonucleotide analogues

20 The synthesis of an oligomer was performed by means  
of Pharmacia's DNA synthesizer, Gene Assembler Plus, on a  
0.2  $\mu\text{mol}$  scale. The concentrations of solvents, reagents,  
and phosphoramidite were the same as for the synthesis of  
natural DNA. A DMTr group of 5'-O-DMTr-thymidine (0.2  $\mu\text{mol}$ )  
25 having a 3'-hydroxyl group bound to a CPG support was  
deprotected with trichloroacetic acid. On its 5'-hydroxyl  
group, condensation reaction was repeated using an amidite  
comprising four nucleic acid bases for natural DNA synthesis

and Compound 21 to synthesize oligonucleotide analogues of  
respective sequences. The synthetic cycle was as follows:

Synthetic cycle (0.2  $\mu$ mol scale)

- 1) Detritylation 1%  $\text{CCl}_3\text{COOH}$  in  $\text{CH}_2\text{ClCH}_2\text{Cl}$ , 6 sec
- 5 2) Coupling 0.1 M phosphoramidite (25 equiv.),  
0.5 M 1H-tetrazole (500 equiv.) in MeCN,  
2 min
- 3) Capping 3% 4-(dimethylamino)pyridine, 10%  $\text{Ac}_2\text{O}$ ,  
in MeCN, 18 sec
- 10 4) Oxidation 0.01 M  $\text{I}_2$  in 2,4,6-collidine/ $\text{H}_2\text{O}$ /MeCN  
(1:5:11), 6 sec

The synthesized oligomer was cleaved from the support  
by treatment with concentrated aqueous ammonia in the  
customary manner. At the same time, the protective  
15 cyanoethyl group was detached from the phosphorus atom, and  
the protective groups for the adenine, guanine and cytosine  
were also removed.

- The resulting 5'-O-dimethoxytritylated  
oligonucleotide analogue was rid of the DMTr group by use of  
20 5 ml trifluoroacetic acid on a reversed phase  
chromatographic column (Millipore, Oligo-Pak<sup>TM</sup>SP), and  
further purified to obtain the desired oligonucleotide  
analogue.

[Experimental Example 1] Measurement of melting  
temperature ( $T_m$ )

20 The melting temperatures ( $T_m$ 's) of annealing products  
between antisense strands, which were the various  
oligonucleotide analogues synthesized in Example 2, and  
natural DNA- or RNA-based sense strands were measured to  
investigate the hybridizing ability of the oligonucleotide  
25 analogues of the present invention for complementary DNA and  
RNA.

Each sample solution (500  $\mu$ L) with end concentrations  
of 100 mM NaCl, 10 mM sodium phosphate buffer (pH 7.2), 4  $\mu$ M

antisense strand, and 4  $\mu$ M sense strand, respectively, was bathed in boiling water, and slowly cooled to room temperature over the course of 10 hours. The sample solution was gradually cooled to 5°C, kept at 5°C for a  
5 further period of 20 minutes, and then started to be measured, with a stream of nitrogen being passed through a cell chamber of a spectrophotometer (UV-2100PC, Shimadzu) for prevention of moisture condensation. The sample temperature was raised at a rate of 0.2°C/minute until 90°C,  
10 and the ultraviolet absorption at 260 nm was measured at intervals of 0.1°C. To prevent changes in the sample concentration with increases in the temperature, the cell was provided with a closure, and a drop of a mineral oil was applied onto the surface of the sample solution during  
15 measurement.

The results are shown in the following table.

5 a): 3'-CGCAAAAAACGA-5' (SEQ ID NO:10) b): 3'-r(CGCAAAAAACGA).

As shown in the table, in the case of the oligomer having one or two units (X) of the nucleoside analogue of the present invention (general formula (Ia)) introduced into a natural DNA strand, the ability to hybridize with the

complementary DNA oligomer, evaluated by the  $T_m$ , rose by 2 to 7 degrees (about 2 degrees per modified residue) as compared with the natural strand. With the oligomer having all T's substituted by X's (X6), the increase in the ability was as high as 11 degrees. When the ability to hybridize with complementary RNA was evaluated, the oligomer incorporating one or two X's had an increase in  $T_m$  of 4 - 10 degrees (4 to 6 degrees per modified residue) over the natural strand. In the case of X6, the ability to hybridize with complementary RNA was further enhanced, showing an increase in  $T_m$  of more than 25 degrees (4 degrees per modified residue). There have been no examples of analogues undergoing such increases in  $T_m$  as compared with natural strands, and the affinity of the claimed oligomer was higher for RNA than for DNA. These facts mean that the oligonucleotide analogue composed of the bicyclicoligonucleoside analogue of the present invention has extremely high performance as an antisense molecule, and is useful as a material for pharmaceuticals.

20 [Experimental Example 2] Measurement of nuclease resistance

A buffer solution (0.003 U/ml, 400  $\mu$ l) of a snake venom phosphodiesterase was mixed with a buffer solution (10  $\mu$ M, 400  $\mu$ l) of the oligonucleotide held at 37°C for 15 minutes. The mixed solution was placed in a quartz cell (800  $\mu$ l) kept at 37°C, and increases in the ultraviolet absorption (260 nm) due to the decomposition of the oligonucleotide were measured over time by means of SHIMADZU

UV-2100PC. The buffer used comprised 0.1 M Tris-HCl (pH 8.6), 0.1 M NaCl, and 14 mM MgCl<sub>2</sub>, and was sufficiently degassed before measurement.

Measurement of half-life ( $t_{1/2}$ ):

- 5 A calculation was made of the average of the values of the UV absorption measured at the start of measurement ( $t=0$ ) and that measured at the time when no increase in this parameter was noted. The time corresponding to this average was designated as the half-life ( $t_{1/2}$ ).

10

Oligonucleotide sequence	$t_{1/2}$ (seconds)
5'-GTTTTTTTTTTC-3' (natural type)	(SEQ ID NO:10) 260
5'-GTTTTTTTTT-XX-C-3' (X2)	(SEQ ID NO:11) 850

15

Charts showing the time course of the ultraviolet absorption are presented as Fig. 1 (natural strand) and Fig. 2 (X2). The ultraviolet absorption reached a plateau in about 30 minutes for the natural strand, and about 90 minutes for X2, after initiation of the enzyme reaction.

INDUSTRIAL APPLICABILITY

- 25 The use of this analogue provides an oligonucleotide analogue antisense molecule, which is minimally hydrolyzable with an enzyme in vivo, has a high sense strand binding ability, and is easily synthesized.
